

Fullstack Developer Task, Apollo Green Solutions

Build a fullstack web application to manage and monitor energy assets.

Requirements:

1. User authentication: register, login, logout
2. Users should be able to create projects and add tasks to each project
3. Backend REST API built with Laravel (PHP)
4. Frontend dashboard built with React and TypeScript
5. PostgreSQL database with a sensible schema
6. README with setup instructions and design decisions

Instructions:

1. Create a new public GitHub repository
2. Upload all project files with a clear README
3. You have questions? Feel free to ask us.
